

Interfaces in C++ (Abstract Classes)

Abstract classes are the way to achieve abstraction in C++. Abstraction in C++ is the process to hide the internal details and showing functionality only. Abstraction can be achieved by two ways:

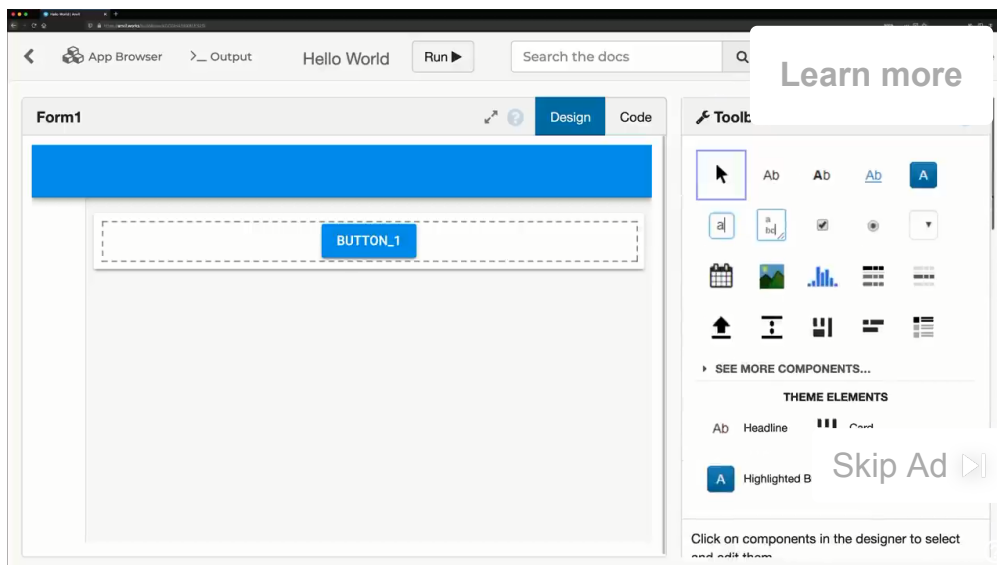

1. **Abstract class**
2. **Interface**

Abstract class and interface both can have abstract methods which are necessary for abstraction.

C++ Abstract class

In C++ class is made abstract by declaring at least one of its functions as `<>strong>pure virtual` function. A pure virtual function is specified by placing `"= 0"` in its declaration. Its implementation must be provided by derived classes.

Let's see an example of abstract class in C++ which has one abstract method `draw()`. Its implementation is provided by derived classes: `Rectangle` and `Circle`. Both classes have different implementation.

```
#include <iostream>
using namespace std;
class Shape
{
public:
    virtual void draw()=0;
};
class Rectangle : Shape
{

```

```
public:
void draw()
{
    cout < <"drawing rectangle..." < <endl;
}
};

class Circle : Shape
{
public:
void draw()
{
    cout <<"drawing circle..." < <endl;
}
};

int main() {
    Rectangle rec;
    Circle cir;
    rec.draw();
    cir.draw();
    return 0;
}
```

Output:

```
drawing rectangle...
drawing circle...
```

GPU Speeds without G

Neural Magic

Say goodbye to expensive and hard-
GPUs. Say hello to pure software AI
acceleration.
